

S-JQA Mark Certification

S-JQA Mark Certification

About the S-JQA Mark

S-JQA Mark Certification is a safety certification scheme for electrical and electronic products. The S-JQA mark is widely used in the market and is recognized as evidence of a product's safety and quality.

- All domestic and overseas businesses that manufacture, sell, or import electrical and electronic products or components are eligible to apply.
- Conformity assessment is conducted pursuant to technical standards specified in the Electrical Appliance and Material Safety Law (DENAN Law). For some products, additional standards adopted by a council called SCEA may also be applied. Products outside the scope of the DENAN Law are certified based on compliance with other applicable standards such as IEC or JIS.
- Conformity assessment is conducted for each model and factory inspections are conducted once per year.

Certification Scope

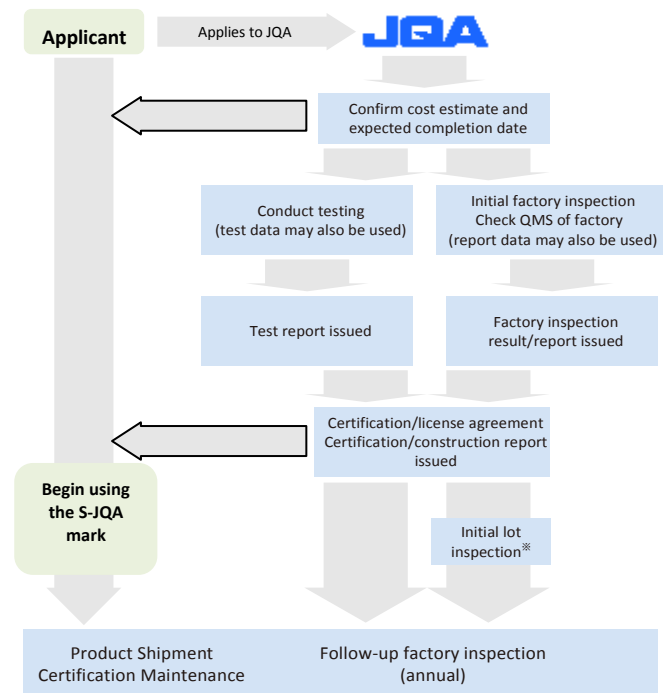

In addition to low-voltage electrical and electronic products, the certification scope also includes materials, components, and subassemblies such as built-in power supply units.

Benefits of the S-JQA Mark

- As an independent body, JQA can offer objective proof that your product conforms to safety standards and meets consumer's product safety expectations.
- Certificate holders can discover points for improvement and ways to enhance their quality management systems through JQA's factory inspections.
- Manufacturers can use the factory inspection reports as tools to check their self-verification required by the DENAN Law for all regulated electrical products.

Certification Procedure

Certification Flowchart

*An initial lot inspection (fees apply) is conducted in any of the following cases:

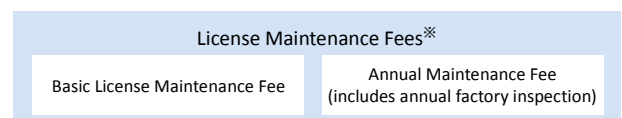

- For first-time applicants to the S-JQA mark scheme
- When a major non-conformity or a large number of minor non-conformities are found during safety testing.
- When requested by the applicant

Certification Costs

Initial Certification Costs

Certification Maintenance Costs

**Travel, accommodation, etc... of inspectors is charged separately.
